

## Multi-function Toolbox

### Universal Data Interface Program

*Plug-and-play data transfer capabilities  
for Synergy 1000 & 2000 SPC Software*

The Synergy 2000 Multi-function Toolbox is a data interface program that facilitates bringing external data into the Synergy 2000 SPC application. The toolbox also works with Zontec's Synergy 1000 SPC program.

Incorporating the latest Microsoft .NET™ software development technologies, the Toolbox is a complete, plug-and-play module that requires no additional programming or software customization.

The Synergy 2000 Multi-function Toolbox is designed for:

- Automating data collection activities
- Integrating data with ERP, LIMS, SCADA Systems and other manufacturing and business applications
- Data migration
- Interconnectivity with multi-vendor hardware platforms and process control devices
- Minimizing or eliminating repetitive Synergy 2000 setup routines

Using the Toolbox, Synergy 2000 users can achieve compatibility with previously isolated systems, enabling them to easily transfer, store, analyze, chart, monitor and report on data for statistical process control (SPC) purposes regardless of its origin.

Typical applications for the Synergy 2000 Multi-function Toolbox include:

- Creating multiple Synergy 2000 Data Tables at one time
- Transferring legacy data from other SPC programs, software applications and databases
- Automatically collecting data in real time from PLCs, CMMs and similar plant equipment
- Serving as a communication bridge between OPC servers and the Synergy 2000 OPC client
- Supporting the AIAG Quality Measurement Data (QMD) Specification as an open exchange format into Synergy 2000 from standard gaging devices
